

Mathematics 172 Homework

The figure above is the phase space for the rate equations

$$\begin{aligned}\frac{dx}{dt} &= xf(x, y) \\ \frac{dy}{dt} &= yg(x, y)\end{aligned}$$

1. Assume that the red curve is where $f(x, y) = 0$ and the green curve is where $g(x, y) = 0$. Also assume $f(x, y) > 0$ for points below the red curve and $g(x, y) > 0$ for points below the green curve.

- Find all the rest points.
- Draw in the arrows in the different regions showing the direction that a point will move.
- Can you tell which of the rest points are stable or unstable? What about long term behavior?

2. This time assume that the red curve is where $g(x, y) = 0$ and the green curve is where $f(x, y) = 0$. Assume that $f(x, y) > 0$ for point below the green curve and $g(x, y) > 0$ for points below the red curve.

- Find all the rest points.

(b) Draw in the arrows in the different regions showing the direction that a point will move.

(c) Can you tell which of the rest points are stable or unstable? What about long term behavior?

3. As a last variant we assume, as in Problem 1, that the red curve is where $f(x, y) = 0$ and the green curve is where $g(x, y) = 0$. Again, as on Problem 1, assume that $f(x, y) > 0$ for points below the red curve, but this time assume that $g(x, y) > 0$ for points above the green curve.

(a) Find all the rest points.

(b) Draw in the arrows in the different regions showing the direction that a point will move.

(c) Can you tell which of the rest points are stable or unstable? What about long term behavior?
