

Quiz 29

Name: Key

You must show your work to get full credit.

Consider the system for two competing species:

$$\frac{dx}{dt} = .2x \left( \frac{80 - x - 2y}{80} \right)$$

$$\frac{dy}{dt} = .3y \left( \frac{90 - 3x - y}{90} \right)$$

$$\begin{aligned} x + 2y &= 80 \\ x\text{-intercept } (80, 0) \\ y\text{-intercept } (0, 40) \end{aligned}$$

$$\begin{aligned} 3x + y &= 90 \\ x\text{-intercept } (30, 0) \\ y\text{-intercept } (0, 90) \end{aligned}$$

1. Draw the lines where  $\frac{dx}{dt} = 0$  and  $\frac{dy}{dt} = 0$ .

2. Find the equilibrium points.

The points are: (0, 0), (80, 0), (0, 90), (20, 30)

$$\begin{aligned} (1) \quad x + 2y &= 80 \\ (2) \quad 3x + y &= 90 \end{aligned}$$

From (2)  $y = 90 - 3x$   
use this in (1)  
 $x + 2(90 - 3x) = 80$   
 $x + 180 - 6x = 80$   
 $-5x = 80 - 180$   
 $-5x = -100$

$$\rightarrow x = \frac{100}{5} = 20$$

$$\begin{aligned} \text{so } y &= 90 - 3x = 90 - 3(20) \\ &= 90 - 60 \\ &= 30 \end{aligned}$$

3. Which of the equilibrium points are stable.

Stable Points: (0, 80), (90, 0)

4. If  $x(0) = 5$  and  $y(0) = 85$  estimate  $x(100)$  and  $y(100)$ .

It starts near (0, 90) and ends up there

$$x(100) \approx \underline{0}$$

$$y(100) \approx \underline{90}$$

5. Circle one: This is competitive coexistence, competitive exclusion.
