

Mathematics 739 Homework 1: Basics about fiber bundles.

As a review of vector bundles we look at a generalization, fiber bundles. These are spaces that are locally products in a nice way.

1. DEFINITIONS, EXAMPLES, AND BASIC PROPERTIES.

Definition 1. A map $p: E \rightarrow B$ is a **fiber bundle** with **fiber** F , if the following hold:

- (a) E and B are topological spaces and p is a continuous map.
- (b) For each $x \in B$ the preimage $p^{-1}[x]$ is homeomorphic to F .
- (c) p is surjective.
- (d) $p: E \rightarrow B$ is locally a product in the following sense. For each $x \in B$ there is an open neighborhood, U_x , of x in B and a homeomorphism $\Psi_U: p^{-1}[U] \rightarrow U \times F$ such that the following diagram commutes.

$$\begin{array}{ccc} p^{-1}[U] & \xrightarrow{\Psi_U} & U \times F \\ \downarrow p & & \downarrow \text{projection} \\ U & \xrightarrow{\text{Identity}} & U \end{array}$$

Such a map Ψ_U is a **local trivialization** of over U . □

In this set up the B is called the **base space** and E the **total space** of the bundle.

The most obvious example of a fiber bundle is the product bundle $E = B \times F$.

The following can be used to give examples that are not products.

Proposition 2. Let $p: E \rightarrow B$ be a covering space with B connected. Then $p: E \rightarrow B$ is a fiber bundle. Conversely any fiber bundle where the fiber has the discrete topology and the base is locally connected is a covering space.

Problem 1. If you know the definition of a covering space, prove this. □

Recall that \mathbb{CP}^n is the space of one dimensional linear subspaces of \mathbb{C}^{n+1} . Let S^{2n+1} be the set of unit vectors in \mathbb{C}^{n+1} . Define a $p: S^{2n+1} \rightarrow \mathbb{CP}^n$ by

$$p(u) = \{zu : z \in \mathbb{C}\} = \text{Linear subspace spanned by } u.$$

Problem 2. Show that $p: S^{2n+1} \rightarrow \mathbb{CP}^n$ is a circle bundle. (A **circle bundle** is a fiber bundle where the fiber is the circle S^1 .)

Problem 3. Let $\psi: F \rightarrow F$ be a homeomorphism. Let E be the quotient space $[0, 1] \times F / \sim$ where \sim is the equivalence relation such that

$$(0, v) \sim (1, \psi(v)).$$

Let $S^1 = [0, 1]/0, 1$ (that is $[0, 1]$ with the end points identified). Let $p: E \rightarrow S^1$ be the map

$$p([t, v]) = t/\{0, 1\}$$

where $[t, v]$ is the equivalence class of (t, v) . Show that this is a fiber bundle over S^1 with fiber F . □

Problem 4. Here is a problem for those that know some differential topology. Let $f: M \rightarrow N$ be a smooth map between connected compact smooth manifolds. Assume that f is a submersion. (That is for all $x \in M$ the derivative $f'(x): T_x M \rightarrow T_{f(x)} N$ is surjective.) Then $f: M \rightarrow N$ is a fiber bundle. \square

Problem 5. Let $B = \{z \in \mathbb{C} : \text{Im}(z) > 0\}$ be the upper half plane. For each $z \in B$ let E_z be the torus

$$E_z = \mathbb{C}/(\mathbb{Z} \oplus \mathbb{Z}z).$$

Set

$$E = \bigcup_{z \in B} E_z.$$

Show that E is a fiber bundle over B . \square

Let $p: E \rightarrow B$ be a fiber bundle. Choose an open cover $\{U_\alpha\}_{\alpha \in A}$ of B such that for each U_α we have a trivialization

$$\Psi_\alpha: p^{-1}[U_\alpha] \rightarrow U_\alpha \times F.$$

For each ordered pair $(\alpha, \beta) \in A \times A$ let $U_{\alpha\beta} = U_\alpha \cap U_\beta$ (this may be empty) define a map

$$g_{\alpha\beta}: U_{\alpha\beta} \rightarrow \mathcal{G}(F)$$

where $\mathcal{G}(F)$ is the group of homeomorphisms of F by

$$g_{\alpha\beta}(x) = \left(\Psi_\alpha \Big|_{p^{-1}(x)} \right) \circ \left(\Psi_\beta \Big|_{p^{-1}(x)} \right)^{-1}.$$

Proposition 3. *The functions $g_{\alpha\beta}$ satisfy the following*

- (a) $g_{\alpha\alpha}(x) = \text{Id}_F$ for all $x \in U_\alpha$.
- (b) *On the intersection $U_{\alpha\beta\gamma} := U_\alpha \cap U_\beta \cap U_\gamma$ we have*

$$g_{\alpha\beta}(x) \circ g_{\beta\gamma}(x) = g_{\alpha\gamma}(x).$$

*This is the **cocycle condition**.*

- (c) *The maps $g_{\alpha\beta}$ are continuous with respect to the natural topology on $\mathcal{G}(F)$.*

Proposition 4. *Prove this. Hint: Since I have not told you what the topology on $\mathcal{G}(F)$ is you can ignore part (c). (One natural topology is the **compact open topology** and if you know what this is, then you can do the problem.)*

Theorem 5. *Let $\{U_\alpha\}_{\alpha \in A}$ be an open cover of B by open sets and let $g_{\alpha\beta}$ be functions that satisfy the conditions of Proposition 3. Then there is fiber bundle $p: E \rightarrow B$ and local trivializations $\Psi_\alpha: p^{-1}[U_\alpha] \rightarrow U_\alpha \times F$ such that the $g_{\alpha\beta}$'s come from the bundle as above.*

Problem 6. Prove this. *Hint:* Let \mathcal{E} be the disjoint union

$$\mathcal{E} := \coprod_{\alpha \in A} U_{\alpha} \times F.$$

Define an equivalence relation on \mathcal{E} by

$$(x_{\alpha}, v_{\alpha}) \sim (x_{\beta}, v_{\beta}) \iff x_{\alpha} = x_{\beta} \text{ and } g_{\alpha\beta}(x_{\alpha})(v_{\alpha}) = v_{\beta}$$

where $(x_{\alpha}, v_{\alpha}) \in U_{\alpha} \times F$. Let E to be the quotient space $E := \mathcal{E} / \sim$. Let $[x, v]$ be the equivalence class of $(x, v) \in \mathcal{E}$ and define $p([x, v]) = x$. Now show that $p: E \rightarrow B$ is the bundle we want. \square

We now relate this back to vector bundles. Let $GL(\mathbb{C}^n)$ be the general linear group. Let $\{U_{\alpha}\}_{\alpha \in A}$ be an open cover of the space B . Assume that for each pair $(\alpha, \beta) \in A^2$ that there is a continuous map

$$g_{\alpha\beta} U_{\alpha\beta} \rightarrow GL(\mathbb{C}^n)$$

and that the functions $g_{\alpha\beta}$ satisfy the cocycle condition. Then we can use the construction of Theorem 5 to construct a fiber bundle $p: E \rightarrow B$ with fiber \mathbb{C}^n .

Problem 7. Show that the construction just outlined gives a vector bundle in the sense that you know and love. \square

Problem 8. In the construction of the last problem assume that B is a complex analytic manifold and that the function $g_{\alpha\beta}$ are holomorphic. Then show that $p: E \rightarrow B$ is a holomorphic vector bundle. That is E is a complex analytic manifold, and p is a holomorphic map. \square

Problem 9. Let M be a n -dimensional complex analytic manifold and let $\{(U_{\alpha}, \phi_{\alpha})\}_{\alpha \in A}$ be a covering of M by holomorphic coordinate charts. That is each U_{α} is an open subset of M and each $\phi_{\alpha}: U_{\alpha} \rightarrow \mathbb{C}^n$ is a map such that $\phi_{\alpha}[U_{\alpha}]$ is an open subset of \mathbb{C}^n and on any overlap $U_{\alpha\beta}$ the map $\psi_{\alpha\beta}: \phi_{\beta}[U_{\alpha\beta}] \rightarrow \phi_{\alpha}[U_{\alpha\beta}]$ by

$$\psi_{\alpha\beta} := (\phi_{\alpha}|_{U_{\alpha\beta}}) \circ (\phi_{\beta}|_{U_{\alpha\beta}})^{-1}.$$

Then on each $U_{\alpha\beta}$ define functions $g_{\alpha\beta}: U_{\alpha\beta} \rightarrow GL(\mathbb{C}^n)$ by

$$g_{\alpha\beta}(x) = \psi'_{\alpha\beta}(x).$$

- (a) Show that the functions $g_{\alpha\beta}$ satisfy the cocycle condition and therefore define a vector bundle. \square
- (b) Show this vector bundle is the holomorphic tangent bundle of M . \square

Problem 10. Using the notation of the last problem, let $1 \leq k \leq n$. Then on each $U_{\alpha\beta}$ define $f_{\alpha\beta}: U_{\alpha\beta} \rightarrow GL(\bigwedge^k(\mathbb{C}^n))$ by

$$f_{\alpha\beta}(x) = \wedge^k(g_{\alpha\beta}(x)).$$

Show this is a holomorphic vector bundle and the fiber at $x \in B$ is the k -th exterior power of tangent space $T_x(M)$. \square

Problem 11. A variant on the last problem and still using the notation of Problem 9 let $f_{\alpha\beta}: U_{\alpha\beta} \rightarrow GL((\mathbb{C}^n)^*)$ (where $(\mathbb{C}^n)^*$ is the dual space to \mathbb{C}^n) by

$$f_{\alpha\beta}(x) = (g_{\alpha\beta}(x)^{-1})^t$$

where A^t is the transpose of the linear map A . Show set of transition functions defines the holomorphic cotangent bundle. \square

Problem 12. Let \mathbb{CP}^n be the space of all one dimensional subspaces of \mathbb{C}^{n+1} . Then the group $GL(\mathbb{C}^n)$ acts on \mathbb{CP}^n by

$$A\langle v \rangle = \langle Av \rangle.$$

This action has a kernel. It is not hard to see that $A\langle v \rangle = \langle v \rangle$ for all $v \in \mathbb{C}^{n+1}$ if and only if $A = \lambda I$ for some $\lambda \in \mathbb{C}^*$. Let $G = GL(\mathbb{C}^{n+1})/\{\lambda I\}$. This is the automorphism group of \mathbb{CP}^n .

- (a) Show that G is a complex analytic manifold.
- (b) Let $\{U_\alpha\}_{\alpha \in A}$ be an open cover of the complex manifold M and $g_{\alpha\beta}: U_{\alpha\beta} \rightarrow G$ be holomorphic maps that satisfy the cocycle condition. Show that the result fiber bundle is a complex analytic manifold and that the fibers are all isomorphic to \mathbb{CP}^n . \square

Theorem 6. Let $\{U_\alpha\}_{\alpha \in A}$ be an open cover of the space B . Let F be another space. Assume that for each $\alpha \in A$ there is a continuous map $h_\alpha: U_\alpha \rightarrow \mathcal{G}(F)$. On $U_{\alpha\beta}$ define

$$g_{\alpha\beta} := h_\alpha|_{U_{\alpha\beta}} \circ h_\beta|_{U_{\alpha\beta}}^{-1}.$$

Show that these function satisfy the cocycle condition and that the resulting fiber bundle is isomorphic to the product bundle $B \times F$. \square

A **section** of the bundle $p: E \rightarrow B$ is a continuous map $s: B \rightarrow E$ such that $p \circ s = \text{Id}_B$. Note every bundle will have any sections. For example let TS^2 be the tangent bundle of the sphere S^2 . Then a section of $p: TS^2 \rightarrow S^2$ is a vector field on S^2 . But we know that any vector vanishes for at least one point. Let E be the bundle of unit vectors in TS^2 . Then E is a circle bundle over S^2 . A section of E would be a vector field that does not vanish at any point. No such vector field exists and therefore E does not have any sections.

Problem 13. Let $\{U_\alpha\}_{\alpha \in A}$ be an open cover of B and $\{g_{\alpha\beta}\}$ transition functions that define a fiber bundle $p: E \rightarrow B$ with fiber F . Assume that there are functions $s_\alpha: U_\alpha \rightarrow F$ such that on each $U_{\alpha\beta}$ they are related by

$$s_\alpha(x) = g_{\alpha\beta}(x)s_\beta(x).$$

Show that this data defines a section of the bundle. \square

Problem 14. Let $p: E \rightarrow B$ be a fiber bundle with fiber F defined by transition functions $\{g_{\alpha\beta}\}$ for the open cover $\{U_\alpha\}_{\alpha \in A}$. Let $h_\alpha: \mathcal{G}(F)$ be continuous

2. A CLASSIFICATION RESULT.

We fix a base space B and a fiber. Let G be a subgroup of $\mathcal{G}(F)$. That is G is some group of homeomorphisms of F . In most of the examples we will be looking at the G will be a group of matrices, or a bit more generally a Lie group.

For the rest of this section we fix an open cover, $\mathcal{U} = \{U_\alpha\}_{\alpha \in A}$, of the space B . The set set, $C_{\mathcal{U}}^0(B)$, of 0-cochains is the set of all sets $\{s_\alpha\}_{\alpha \in A}$ where s_α is a continuous functions $s_\alpha: U_\alpha \rightarrow G$.

Proposition 7. *The set $C_{\mathcal{U}}^0(B)$ is a group under the operation*

$$\{s_\alpha\}_{\alpha \in A} \cdot \{s'_\alpha\}_{\alpha \in A} = \{s_\alpha \cdot s'_\alpha\}_{\alpha \in A}.$$

The identity element is element with $s_\alpha = 1$ for all α .

Problem 15. Prove this. □

Let $C_{\mathcal{U}}^1(B)$ be the set of all collections $\{c_{\alpha\beta}\}_{(\alpha,\beta) \in A^2}$ where $c_{\alpha\beta}: U_{\alpha\beta} \rightarrow G$ is a continuous function.

Proposition 8. *Which a group operation analogous to that for $C_{\mathcal{U}}^0(B)$, the set $C_{\mathcal{U}}^1(B)$ is a group.*

Problem 16. Prove this. □

Define a map $d_0: C_{\mathcal{U}}^0(B) \rightarrow C_{\mathcal{U}}^1(B)$ by

$$d_0(\{s_\alpha\}_{\alpha \in A})_{\alpha\beta}(x) = s_\alpha(x)s_\beta(x)^{-1}$$

for $x \in U_{\alpha\beta}$.

Problem 17. Show that if G is Abelian that d_0 is a group homomorphism. Give an example to show that d_0 is not a homomorphism when G is not Abelian. □

Proposition 9. *If $d_0(\{s_\alpha\}_{\alpha \in A}) = 1$, then there is a continuous function $s: B \rightarrow G$ such that for all α we have $s_\alpha = s|_{U_\alpha}$.*

Problem 18. Prove this. □

Now let $Z_{\mathcal{U}}^1(B)$ of elements of $C_{\mathcal{U}}^1(B)$ that satisfy the cocycle condition. Define an equivalence relation on $Z_{\mathcal{U}}^1(B)$ by

$$\{g_{\alpha\beta}\} \sim \{g'_{\alpha\beta}\} \iff \exists \{s_\alpha\} \in C_{\mathcal{U}}^0(B) \text{ such that } g_{\alpha\beta} = s_\alpha g'_{\alpha\beta} s_\beta^{-1}.$$

Set

$$H_{\mathcal{U}}^1(B) = C_{\mathcal{U}}^1(B) / \sim.$$

Proposition 10. *If the group G is Abelian, then $H_{\mathcal{U}}^1(B)$ is an Abelian group in a natural way.*

Problem 19. Prove this. □

Problem 20. Let $p: E \rightarrow B$ and $p': E' \rightarrow B$ be fiber bundles over the same base B . Define what it means for these bundles to be *isomorphic*.

We say that the fiber $p: E \rightarrow B$ is ***adapted to \mathcal{U}*** if and only if for each $U_\alpha \in \mathcal{U}$ the bundle $p|_{p^{-1}[U_\alpha]}: p^{-1}[U_\alpha] \rightarrow U_\alpha$ is isomorphic to the product bundle $U_\alpha \times F$.

Theorem 11. *There is a natural bijective correspondence between the isomorphism classes of \mathcal{U} adapted fiber bundles $p: E \rightarrow B$ over B and the set $H_{\mathcal{U}}^1(B)$.*

Problem 21. Give a precise statement of the last theorem and prove it. \square
