Consider the system of rate equations:

tions: 
$$x = 0, x + 2y = 80$$

$$\frac{dx}{dt} = .2x \left(\frac{80 - x - 2y}{80}\right) \qquad \qquad x - 14 + 2y = 80$$

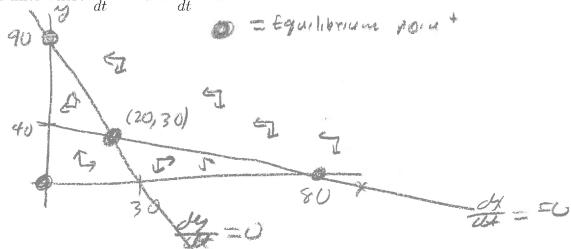

$$\frac{dy}{dt} = .3y \left(\frac{90 - 3x - y}{90}\right) \qquad \qquad y = 0 \qquad 3x + 4y = 90$$

$$x - 14 + 2y = 4 \qquad (30, 0)$$

$$y - 14 + 2y = 4 \qquad (30, 0)$$

for two competing species.

1. Draw the lines where  $\frac{dx}{dt} = 0$  and  $\frac{dy}{dt} = 0$ .

2. Find the equilibrium points.

The equilibrium points are (0,0), (80,0), (0,90),

① 
$$\chi + 249 = 80$$
  
②  $3\chi + 49 = 90$   
From  $49 = 90 - 3\chi$   
Use this in ①  $\chi + 2(90 - 3\chi) = 80$ 

$$7 - 5x = -100$$

$$3x + 49 = 90$$

$$x = 100 = 70$$

$$x = 100 = 70$$
From  $49 = 90 - 3x$ 

$$4 = 90 - 3x = 90 - 3(20) = 30$$

$$x + 2(90 - 3x) = 80$$

$$x + 2(90 - 3x) = 80$$

$$x + 2(90 - 3x) = 80$$

$$x = 90$$

$$x = 90 - 3x = 90 - 3(20) = 30$$

$$x = 90 - 3x = 90 - 3(20) = 30$$

3. Which of the equilibrium points are stable.

The stable points are (80,0), 10,90
